

Recall that a *basis* for a vector space is a linearly independent spanning set, and that the *dimension* of a vector space is the size of a (any) basis for the space.

If  $K$  is an extension field of  $F$ , we can view  $K$  as a vector space over the field of scalars  $F$ . In this case, we say the **degree** of  $K$  over  $F$ , written  $[K : F]$  is the dimension of this vector space.

1. Find a basis for  $\mathbb{Q}(\sqrt[3]{5})$  over  $\mathbb{Q}$ . What is  $[\mathbb{Q}(\sqrt[3]{5}) : \mathbb{Q}]$ ?
  
  
  
  
  
  
  
  
  
  
2. Find a basis for  $\mathbb{Q}(\sqrt{7})$  over  $\mathbb{Q}$ . What is  $[\mathbb{Q}(\sqrt{7}) : \mathbb{Q}]$ ?
  
  
  
  
  
  
  
  
  
  
3. Suppose  $\alpha$  is a root of  $p(x) = x^5 - 6x^4 + 9x^2 + 3$ . Find a basis for  $\mathbb{Q}(\alpha)$  over  $\mathbb{Q}$ . What is  $[\mathbb{Q}(\alpha) : \mathbb{Q}]$ .
  
  
  
  
  
  
  
  
  
  
4. What is the connection between the degree of a field extension and polynomials? Investigate this. In particular, if you claim that you can always find a basis in some systematic way, how do you know it is really a basis? How do you know the basis is linearly independent? How do you know it spans?
  
  
  
  
  
  
  
  
  
  
5. The polynomial  $q(x) = x^7 - 6x^6 - 7x^5 + 51x^4 - 60x^2 - 21$  has  $\alpha$  (from question 3) and  $\sqrt{7}$  as roots. Does this mean  $[\mathbb{Q}(\sqrt{7}) : \mathbb{Q}] = [\mathbb{Q}(\alpha) : \mathbb{Q}] = 7$ ? Why not?
